

Blood Report Analysis

Generated on: 10/17/2025

Okay, let's take a look at your blood test results.

Regarding the overall health, the first blood test report looks great. All the values are within the normal range, which is what we want to see.

However, in the second blood test report some results are outside the expected range. Specifically:

- * **Hemoglobin (Hb)** is **low**. This measures the amount of oxygen-carrying protein in your red blood cells.
- * **RBC Count** is **slightly low**. This is the number of red blood cells you have.
- * **Hematocrit (PCV)** is **low**. This measures the percentage of your blood that is made up of red blood cells.

These three results are related. A low hemoglobin, RBC count, and hematocrit often suggest you might have **anemia**. This means your body isn't getting enough oxygen, which can cause you to feel tired or weak.

The rest of your blood counts (white blood cells, platelets, neutrophils, lymphocytes, monocytes, eosinophils, basophils) are all within the normal range, which is good.

Simple Advice: It's important to **see your doctor** about these results. Anemia can be caused by different things, like iron deficiency or other underlying conditions. Your doctor can order more tests to figure out the cause and recommend the best course of treatment for you. In the meantime, make sure you're eating a balanced diet.
